In theoretical physics, twistor theory was proposed by Roger Penrose in 1967 as a possible path to quantum gravity and has evolved into a branch of theoretical and mathematical physics. Penrose proposed that twistor space should be the basic arena for physics from which space-time itself should emerge. It leads to a powerful set of mathematical tools that have applications to differential and integral geometry, nonlinear differential equations and representation theory and in physics to general

An Introduction to Twistor Theory by S. A. Huggett

In very general terms, twistor theory consists of the association of a complex space (twistor space) to a real space in a natural and useful way. By useful, we mean that some important (second order differential) equations - e.g. the zero-rest-mass field equations, the harmonic map equation - can be solved in terms of holomorphic data in the twistor space.

Twistor theory began with the work of Roger Penrose who introduced the powerful techniques of complex algebraic geometry into general relativity. Loosely speaking it is the use of complex analytic methods to solve problems in real differential geometry. In most cases the emphasis is on the geometry of the problem rather than the analysis.

Twistor Theory.

As with string theory, the brilliant physicist Sir Roger Penrose's twistor theory has provided some mathematical insights into the existing theories of physics, including some that lie at the heart of the Standard Model of particle physics. For nearly four decades, Penrose has been exploring his own mathematical approach — twistor theory.

String Theory and Twistor Theory - dummies

Twistor theory is a fascinating topic with a checkered past. It was first introduced fifty years ago by Penrose, with the long-term ambition of developing a novel approach to quantum gravity. Despite many interesting initial advances, the subject stalled significantly by the late 1980s due to

This book is an introduction to twistor theory and modern geometrical approaches to space-time structure at the graduate or advanced undergraduate level. It will be valuable also to the physicist as an introduction to some of the mathematics that has proved useful in these areas, and to the mathematician as an example of where sheaf cohomology and complex manifold theory can be used in physics.

An Introduction To Twistor Theory

TWISTOR theory is the creation of the great British mathematician and physicist, Professor Sir Roger Penrose, FRS, OM. The idea of twistor theory is that space and time should be described in a completely new way using the geometry of twistor space. Then fundamental physics should be reformulated in this twistor geometry.

In theoretical and mathematical physics, twistor theory is a theory proposed by Roger Penrose in 1967, as a possible path to a theory of quantum gravity. In twistor theory, the Penrose transform maps Minkowski space into twistor space, taking the geometric objects from a 4-dimensional space with a Hermitian form of signature (2,2) to geometric objects in twistor space, specified by complex coordinates, called twistors.

After a quick introduction and review of tensors the concept of spinors is introduced. It's the usual approach drawing a correspondence between a vector and a rank (1,1) spinor. In particular between a null vector and the product of a spinor with its own conjugate. This is often informally phrased by saying a spinor is the square root of a vector.

Introduction. In the past 30 years a lot of work has been done on developing twistor theory. Its creator, Roger Penrose, was first led to the concept of twistors in his investigation of the structure of spacetime and it was he who first saw the wide range of applications for this new mathematical construct.

Twistor Primer - University of Oxford

Category theory formalizes mathematical structure and its concepts in terms of a labeled directed graph called a category, whose nodes are called objects, and whose labelled directed edges are called arrows (or morphisms). A category has two basic properties: the ability to compose the arrows associatively, and the existence of an identity arrow for each object.
